# **Python Basics!**

dictionaries, mutable arguments

CS101 Lecture #11

# Administrivia

Administrivia 1/39

#### Administrivia

- ▶ Homework #5 is due Friday Sep. 30.
- Midterm #1 will be Monday Oct. 3. (7 p.m.) No class on Monday, Labs WILL be held all week. Contact cs101admin@cs.illinois.edu for conflict exam.

Administrivia 2/39

#### Administrivia

AYA AYB AYC AYD AYE	Gregory Hall 112
AYF AYG AYH AYI	Wohlers Hall 141
AYJ AYK AYL	Main Library 66
AYM AYN AYO	Siebel Center 1404
AYP AYQ AYR	David Kinley Hall 114

Administrivia 3/39

#### Midterm Instructions

- ⇒ 30 multiple-choice questions
- 60 minutes
- Requires NetID and University I-Card.
- Exams are unique—omitting the exam code will dock one letter grade (10%).

Administrivia 4/39

# Warmup Quiz

Warmup Quiz 5/39

#### Question # \( \)

```
a = [[1,2,3], [4,5,6], [7,8,9]]
```

How would you refer to the value 8?

A a[2][3]

B a[1][2]

C a[2,3]

D a[2][1]

Warmup Quiz 6/39

#### Question #2

```
x = [ 'a', 'b']
y = [ 'c', 'd']
def add_it( x,y ):
    y.append(x)
add it( y,x )
What is the final value of x?
 A [ 'a', 'b', 'c', 'd']
 B [ 'a', 'b']
 C['a', 'b', ['c', 'd']]
 D None
```

Warmup Quiz 7/3

#### Question #3

```
x = [ 'a', 'b']
y = [ 'c', 'd']
def add_it( x,y ):
    y.append(x)
add it( v.x )
What is the final value of x?
 A [ 'a', 'b', 'c', 'd']
 B [ 'a', 'b']
 C['a', 'b', ['c', 'd']]
 D None
```

Warmup Quiz 8/39

# Question #1 (Worked)

```
a = 1
def fun(c,b):
    return c + b
a = fun(a,a) + a
```

Warmup Quiz 9/39

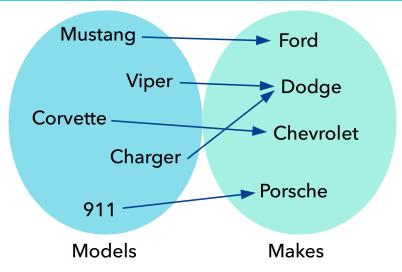

# **Dictionaries**

# **dict** data type

- ▶ How do we index a list?
- ▶ lists and tuples are ordered.
- What else may make sense—how else could you organize data?

Dictionaries 11/39

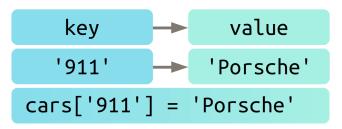

# Example

Dictionaries 12/39

### dict data type

- The dict indexes data by any value (unordered).
- Easy to think of as dictionary, but can use lots besides strings.
- **▶** This container maps keys to values.

Dictionaries 13/3

## *dict* data type

```
cars = {}
cars[ 'Mustang' ] = 'Ford'
cars[ 'Viper' ] = 'Dodge'
cars[ 'Corvette' ] = 'Chevrolet'
cars[ 'Charger' ] = 'Dodge'
cars[ '911' ] = 'Porsche'
```

Dictionaries 14/39

#### **dict** literals

- ➤ We create a dict as follows:
  - opening brace {
  - key : value pairs, separated by commas
  - closing brace }

```
model = {
    'Civic': 'Honda',
    'Mustang': 'Ford',
    'Model S': 'Tesla',
    'Model T': 'Ford'
}
```

Dictionaries 15/3

### dict operations & methods

```
d = { 'one':1, 'two':2, 'three':3 }
print( d['one'] )
d[ 'four' ] = 4
del d[ 'four' ]
'five' in d
for key in d: # no guarantee on order
    print( key, d[key] )
d.keys()
d.values()
```

Dictionaries 16/3

### Example

```
d = { 'a':2, 'c':3, 'b':1 }
x = d[ 'a' ] + d[ 'c' ]

What is the final value of x?
A 4
B 'ac'
C '5'
D 5
```

Dictionaries 17/3

## Example

```
d = \{ \}
words = [ 'red', 'orange', 'yellow' ]
for word in words:
    d[ word ] = words.index( word )
What is the final value of d?
 A { 'red':3, 'orange':6, 'yellow':6 }
 B { 'red':0, 'orange':2, 'yellow':2 }
 C None
 D {'orange': 1, 'red': 0, 'yellow': 2}
```

Dictionaries 18/3

# dict applications

 Dictionaries can encode/decode data, or translate from one representation to another.

```
x = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
y = 'BCDEFGHIJKLMNOPQRSTUVWXYZA'
e = { }
for i in range( len(x) ):
    e[ x[i] ] = y[i]
encoded = "
for c in 'HELLO':
    encoded += e[c]
```

➤ How would you reverse (decode) this?

lictionaries 19/3

# dict applications

```
x = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
y = 'BCDEFGHIJKLMNOPQRSTUVWXYZA'
d = { }
for i in range( len(x) ):
    d [y[i] ] = x[i]
decoded = "
for c in encoded:
    decoded += d[c]
```

Dictionaries 20/3

#### Exercise

- Encode all of the words in a file using a Caesar cipher.
- Decode all of the words in the file.

Dictionaries 21/3

# dict applications

 Dictionaries can also function as accumulators.

```
x = 'ABBACAB'
d = { }
for c in x:
    if c not in d:
        d[c] = 0
        d[c] += 1
```

▶ How would you reverse (decode) this?

Dictionaries 22/3

#### Exercise

- Count category frequencies in Jeopardy questions.
- ➤ Count bigram frequencies in Jeopardy clues.

Octionaries 23/3

# dict applications

We can link data based on a common field.

Dictionaries 24/39

# **Mutable Arguments**

Mutable Arguments 25/3'

### Exercise: mutability

```
x = [3,2,1]
V = X
y.sort()
x.append(0)
What is the final value of x?
 A [ 3,2,1 ]
 B [ 1,2,3 ]
 C [ 1,2,3,0 ]
 D [ 0,1,2,3 ]
```

Mutable Arguments 26/3

# Mutable arguments

- Mutability causes lists to work differently in functions.
- lists used as arguments can be changed by the function.
- ➤ This is very useful!

```
def fun(q):
        q.append(3)
a = [ ]
for i in range(3):
        fun(a)
print(a)
```

Mutable Arguments 27/3

# Mutable arguments

Mutable Arguments 28/39

# Mutable arguments

```
def readfile(fname,a):
    for line in open(fname):
        a.append(line)

all_lines = []
for f in open("filenames.txt"):
    readfile(f,all lines)
```

Mutable Arguments 29/39

# Copying mutable values

- What if we want a copy of a list (not an alias)?
- Slice!

```
x = [ 3,2,1 ]
y = x[ : ]
y.sort()
print( x )
```

Mutable Arguments 30/39

# Copying mutable values

```
x = [ 1,2,3 ]
y = x[ : ]
y.append( 4 )
print( x == y )
```

Mutable Arguments 31/.

# String/List Methods

String/List Methods 32/3

### string.split method

- split returns a list.
- **▶** Takes a single string argument, the delimiter.

```
name = 'Oliver Wendell Holmes'
names = name.split(' ')
print(m[-1])
```

String/List Methods 33/3

## Example

```
x = 'A+B+C'
y = x.split('+')

What is the final value of y?
A 'ABC'
B [ 'A','B','C' ]
C 'A','B','C'
D None
```

String/List Methods 34/39

# Example

```
x = 'A+B+C'
y = x.split('-')

What is the final value of y?
  A 'A+B+C'
  B [ 'A+B+C' ]
  C ( 'A+B+C' )
  D None
```

String/List Methods 35/39

### string.join method

- join returns a str.
- ▶ Takes a single list argument.
- **▶** Returns the list elements joined as a string.

```
names = [ "Geoffrey", "Richard", "Aloysius", "Jo
','.join(names) # note the odd syntax!
```

String/List Methods 36/3

## Example

```
a = [ 'X', 'A', 'G']
b = a[:]
a.sort()
x = ', '.join(b)
What is the final value of x?
 A 'XAG'
 B [ 'X,A,G' ]
C'A,G,X'
 D',A,G,X.'
```

String/List Methods 37/3

# Reminders

Reminders 38/39

#### Reminders

- ▶ Homework #5 is due Friday Sep. 30.
- Midterm #1 will be Monday Oct. 3. (7 p.m.) No class on Monday, Labs WILL be held all week. Contact cs101admin@cs.illinois.edu for conflict exam.

Reminders 39/39
